Background

Ever since YAM/Sushi bring yield farming forward, most of the DeFi projects can only survive a so called meme period and totally unsustainable. A common hint is that all those DAPP projects lose control of LP, especially for the pool1 LP, or in other word, whales. The project CORE has completely changed the game with LP forever lock and achieved spectacular success.

Pump.Farm is an experiment projects that aims to discover what happens with a fairly launches a governance token that is designed to reward long-term holders and naturally pump. Unlike CORE, Pump.Farm adopts another LP lock strategy to achieve long-term development. Besides LP lock, the buyback policy will ensure projects a natural pump curve.

Meanwhile, with Pump.Farm, smart contract timelock and team liquidity lock will surely be implied. By doing so, pump will be rug pull protected.

Pumpnomics

Name: Pump.Farm

Ticker: PPF

MAX Supply: 3,300,000

Fair Distribution: PPF tokens will be fairly distributed through Uniswap Listing and PPF Farm. No ICO, NO VC, NO Premine.

Initial Uniswap Listing: 300,000

Time: UTC 03:00 November 26, 2020

Liquidity Farm Rewards: 3,000,000

Team Share: 0, the team does not own any PPF, the members of the dev team has to farm or buy their PPF the same as every other participant does. However, for the team further development and the marketing fee, there will be a stake fee during farming (as explained in details in the following page).

PPF LP Lock Differentiation

Much like other decentralized yield farming protocols, PPF deploys vaults with yield farming strategies. Vaults always contain a singular stable coin or other and award a token of equal value to the yield deposited into the PPF. Again, similarly to other vault protocols, the PPF Vaults deploy a yield farming strategy using the vault holdings and generating interest.

The key difference between the PPF and other vaults is what happens with staked LP. PPF adopts a unique LP lock differentiation strategy. In the beginning, there will be 4 types of ETH-PPF pool with different LP lock periods:

LP Lock	Pool	Pump Fee	Farm Index
Lock 30 days	PPF Rhino	3%	30
Lock 7 days	PPF Deer	5%	7
Lock 1 day	PPF Squirrel	10%	1
Lock 0 day	PPF Egg	10%	0.5

Basically, as mentioned in the beginning, and also inspired by CORE, PPF rewards strong Hands; meanwhile, for all stake fees, will all be used for PPF buyback.

There is No Premine, No ICO, No VC, No dev mint, and the launch is designed in such a way that guarantees that bots don't have any advantage over humans. PPF guarantees fair distribution and prevents unhealthy selloffs.

Governance

Too many farming projects don't actually do anything for the community. PPF, instead, as an experiment, actually plans to give the power to the community. The owner of the PPF contracts will not be the dev team, but will constitute a governance contract controlled by all PPF holders.

Similar to Pickle, of which the governance structure prompted a response from Vitalik Buterin himself. PPF is innovative in this area by using quadratic voting—which takes the square root of each vote instead of counting it nominally—to prevent whales from enjoying too much influence. Together with a 48-hour Timelock system, all participants' proposals will be smoothly and safely executed.

Some powers that committee members have are:

- 1, Reaching consensus to implement specific code that cannot be automatically deployed;
- 2, The power to implement emergency suspension under special circumstances;
- 3, Punishing bad actors within the PPF ecosystem (such as malicious/false claims, etc.).

PPF members can negotiate and propose relevant proposals for the benefit of the PPF ecosystem. The voting proposals they submit must include clear voting options and recommendations. 2-7 days will be given to any PPF holder to vote, and the result with a majority decision will be executed by team after 48 hours.

Pump.Farm Contracts

Disclaimer

The following contains an overview of the most important mechanics in each of PPF's primary contracts. We strongly recommend that you fully review the contracts to verify that our statements are accurate. PPF is a decentralized financial experiment that distributes a valueless governance token to those that want to participate.

Never participate with more than you can afford to lose!
DYOR, and only trust the code.

There are two primary contracts that handle the core features of PPF protocols. Team will further develop the governance

contract for community proposing, voting on, and executing. All of these contracts can be reviewed from our public GitHub: <https://github.com/PumpFarmCode/Contracts>

Primary Contracts

- **PPF.sol:** PPF token contract (Modified ERC-20)
- **Timelock.sol:** Timelock contract that adds a delay to the execution of successful governance proposals in PPF, and the initial timelock will be 48 hours (Modified Timelock.sol from SushiSwap)

Farm Contracts

- **MasterChef.sol:** Earn PPF with a 30-day / 7-day / 1-day / 0-day LP lock (Modified MasterChef.sol from SushiSwap)

By Community & For Community

Cryptocurrency is a highly competitive, open market. PPF has competitors, such as CORE, NAMI, and we are confident that we are providing a tokenomics with a higher value proposition and selloffs resistance to our community than our competitors. PPF is purposefully designed to solve the farm-related problems and allow anyone to become a long-term player in the DeFi wave.

With a fair distribution and hodler friendly ecosystem, it's time to protect each other. It's time to stop investing in projects with unverified code, unaudited code, or an unfair distribution. It's time to raise our standards and demand projects that focus on transparency, community, and sustainability.

It's time to pump.

Thanks
